

SYNOPSIS

TITLE

Vibe Matching Fashion System And Customization

INTRODUCTION

Online fashion shopping has grown rapidly due to increased internet access and digital convenience. Customers today expect more than just product listings; they seek personalized recommendations, accurate size selection, and coordinated styling options. However, many existing fashion platforms provide generic suggestions and limited assistance in matching dresses with ornaments and cosmetics, making it difficult for users to make confident purchase decisions.

To overcome these challenges, modern fashion systems are adopting artificial intelligence and smart recommendation techniques. This project focuses on creating an intelligent fashion platform that understands a user's personal style or "vibe" and offers coordinated fashion solutions. By combining vibe-based recommendations, standard size charts, customization options, and an efficient e-commerce workflow, the system aims to improve user satisfaction and reduce product returns.

OBJECTIVE

The objective of this project is to develop an intelligent vibe-based fashion system that provides personalized recommendations for dresses, ornaments, and cosmetics. The system aims to analyze user preferences such as style, color choice, occasion, and body type to suggest coordinated fashion items. It also focuses on implementing standard size charts for dresses and ornaments to improve size accuracy and reduce fitting issues. Another objective is to provide customization options and a virtual preview feature to enhance user confidence before purchase. The project aims to integrate secure order processing, payment, and real-time delivery tracking. Overall, the system seeks to improve user satisfaction and reduce product return rates in online fashion shopping. Additionally, the platform aims to offer a user-friendly interface that simplifies fashion selection and decision-making. The system also supports efficient management for sellers and administrators through a centralized dashboard.

TECHNOLOGIES USED

Frontend:

- Flutter (Web)
- Dart

Backend:

- Python (FastAPI / Django)

Database:

- MySQL / PostgreSQL / SQLite

MODULES

1.User Registration and Profile Management Module

- Allows users to register, log in, and securely access the platform
- Stores user preferences such as style, color, and occasion
- Maintains order history and wishlist
- Enables personalized recommendations based on profile data

2.Vibe Matching and Recommendation Module

- Analyzes user preferences to identify fashion vibe
- Recommends matching dresses, ornaments, and cosmetics
- Provides occasion-based and trend-based suggestions
- Enhances coordinated styling and decision-making

3. Size Chart Management Module

- Provides standard size charts for dresses
- Maintains separate size charts for ornaments
- Offers size guidance to reduce selection errors
- Improves fitting accuracy and user confidence

4. Customization and Virtual Preview Module

- Allows customization of dress designs, fabrics, and colors
- Supports ornament and cosmetic customization
- Displays virtual preview of selected combinations
- Helps users visualize final appearance before ordering

5. Product and Inventory Management Module

- Manages product catalog and availability
- Tracks inventory levels
- Updates size charts and customization options
- Supports seller and designer operations

6. Order and Payment Module

- Handles cart and checkout processes
- Integrates secure payment gateways
- Generates order confirmations and invoices
- Ensures safe and reliable transactions

7. Delivery and Tracking Module

- Schedules product delivery
- Provides real-time order tracking
- Sends order status notifications
- Improves transparency and customer trust

8. Admin and Seller Dashboard Module

- Manages users, sellers, and designers
- Monitors orders and delivery status
- Controls inventory and customization requests
- Generates reports and analytics

EXPECTED OUTCOME

The proposed system introduces an intelligent and personalized fashion shopping platform based on vibe matching. It analyzes user preferences such as color choice, occasion, fashion interests, and body type to recommend matching dresses, ornaments, and cosmetics in a coordinated manner. This helps users achieve a complete and stylish look without manual effort. Instead of complex AI camera measurements, the system uses **standardized size charts**, with separate charts for dresses and ornaments. Users can select accurate sizes using predefined measurements, ensuring simplicity and reliability. The platform also supports product customization, secure payments, order tracking, and an admin dashboard for efficient management, resulting in a seamless end-to-end shopping experience.

CONCLUSION

The **Vibe Matching Fashion System with Customization and Smart Sizing** provides a modern solution to the limitations of traditional online fashion platforms. By focusing on personalized recommendations, standardized sizing, and coordinated fashion matching, the system enhances the overall shopping experience. Users can confidently select outfits that match their style, occasion, and preferences while avoiding size-related issues. The integration of customization features, secure payments, and real-time order tracking ensures a seamless and reliable e-commerce workflow. This project demonstrates how artificial intelligence and modern web technologies can be effectively used to transform online fashion shopping into a more intelligent, efficient, and user-friendly digital experience.
